

Stamped Concrete Imprinted or Textured concrete, designed To Replicate Stone, Tile, Brick, or even wood. Popular and affordable choice for Patios, Pool Decks, Driveways and More.

Technical Data/ Specifications General Stamped Concrete System is cast-in-place concrete, integrally colored and stamped platform / texturing tools to produce a surface similar to natural stone, brick, slate and other natural paving materials. Base color is achieved through integral color pigments in the concrete mix or surface treated with color hardeners. A powdered color release agent is used in the stamping process and insures maximum surface detail while providing a second color for surface highlights and distinctive grout line look. A special acrylic base sealer added in the curing process provides full color depth and richness with maximum concrete protection. All work shall meet ASTM C 94 and ACI 332 requirements for placement of concrete surfaces. This includes sub-grade preparation and forming concrete. When the concrete truck arrives, add specified color together with reinforcing fibers. Mix integral color and fibers thoroughly in concrete truck prior to placement. The concrete is then placed at a thickness of 4" (10 cm) or 6" (15 cm) for heavier uses, screed, bull floated, and edged before applying clear or colored release agent on the surface. Release agent is applied evenly over the entire surface before stamping the surface. While in the plastic state, place stamping tools onto the surface and start stamping by using tamper to get the desired texture. Remove excess release agent and saw cut all control cuts 1/3 the thickness of slab, within 12 hours. When surface is dry, apply two coats of clear acrylic sealer to protect surface from fading or staining due to nature's elements.

CONCRETE MIX DESIGN

In freeze-thaw areas, the concrete mix design shall be a minimum of M25. Portland cement shall meet the requirements of ASTM-C 150. Cement content shall be 335-350 kg/m³ and 900 grams PP fiber per 50 Kg of cement. Add Color as specified. Slump 80 to 100 mm maximum water-cement ratio shall be 0.44 by weight. Coarse aggregate shall be in accordance with ASTM C 33 maximum size 14mm. Air-Entrainment 7% (\pm 1%) while using Integral Color, or 3% (+/- 1%) using Color Hardeners.

In non-freeze areas the concrete mix design shall be a minimum 3,000 psi (24.5mpa), compressive strength shall be 3,000 psi (24.5mpa) at 28 days. Portland cement shall meet the requirements of ASTM-C 150. Cement content shall be 300 kg/m³, and 900 grams PP fiber per 50 Kg of cement. Add Color as specified. Slump 80 to 100 mm maximum water-cement ratio shall be 0.44 by weight. Coarse aggregate shall be in accordance with ASTM C 33 maximum size 14mm. Air-Entrainment 7% (\pm 1%) while using Integral Color, or 3% (+/- 1%) using Color Hardeners
